## *A point in camera geometry*

A point is expressed with several coordinate system.

### 3D points in world coordinate

A point  $\mathbf{X}_w = (X_w, Y_w, Z_w)^T$  in a world coordinate.

### 3D points in camera coordinate

A point  $\mathbf{X}_c = (X_c, Y_c, Z_c)^T$  in a camera coordinate.

### 2D points in image coordinate

A point  $\mathbf{x} = (x, y)^T$  in an image plane.

## *Projection matrix*

A  $3 \times 4$  projection matrix  $\mathbf{P}$  denotes relationship between  $\mathbf{X}_w$  and  $\mathbf{x}$  as

$$\mathbf{x} = \mathbf{P}\mathbf{X}_w, \quad (1)$$

$$\rightarrow s \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} = \begin{bmatrix} p_{11} & p_{12} & p_{13} & p_{14} \\ p_{21} & p_{22} & p_{23} & p_{24} \\ p_{31} & p_{32} & p_{33} & p_{34} \end{bmatrix} \begin{bmatrix} X_w \\ Y_w \\ Z_w \\ 1 \end{bmatrix}. \quad (2)$$

## *Intrinsic and extrinsic parameters*

A projection matrix can be decomposed into two components, intrinsic and extrinsic parameters, as

$$\mathbf{x} = \mathbf{P}\mathbf{X}_w = \mathbf{A}[\mathbf{R}|\mathbf{t}]\mathbf{X}_w, \quad (3)$$

$$\rightarrow \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} = \begin{bmatrix} \alpha_x & s & x_0 \\ 0 & \alpha_y & y_0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} r_{11} & r_{12} & r_{13} & t_1 \\ r_{21} & r_{22} & r_{23} & t_2 \\ r_{31} & r_{32} & r_{33} & t_3 \end{bmatrix} \begin{bmatrix} X_w \\ Y_w \\ Z_w \\ 1 \end{bmatrix}, \quad (4)$$

where

- Intrinsic:  $3 \times 3$  calibration matrix  $\mathbf{A}$ .
- Extrinsic:  $3 \times 3$  Rotation matrix  $\mathbf{R}$  and  $3 \times 1$  translation vector  $\mathbf{t}$ .

## *Extrinsic parameters*

Denotes transformation between  $\mathbf{X}_w$  and  $\mathbf{X}_c$  as

$$\mathbf{X}_c = [\mathbf{R}|\mathbf{t}] \mathbf{X}_w, \quad (5)$$

$$\begin{bmatrix} X_c \\ Y_c \\ Z_c \\ 1 \end{bmatrix} = \begin{bmatrix} r_{11} & r_{12} & r_{13} & t_1 \\ r_{21} & r_{22} & r_{23} & t_2 \\ r_{31} & r_{32} & r_{33} & t_3 \end{bmatrix} \begin{bmatrix} X_w \\ Y_w \\ Z_w \\ 1 \end{bmatrix}. \quad (6)$$

## *Intrinsic parameters*

Project a 3D point  $\mathbf{X}_c$  to image plane as

$$\mathbf{x} = \mathbf{A} [\mathbf{R} | \mathbf{t}] \mathbf{X}_w = \mathbf{A} \mathbf{X}_c, \quad (7)$$

$$\rightarrow \begin{bmatrix} x \\ y \\ 1 \end{bmatrix} = \begin{bmatrix} \alpha_x & s & x_0 \\ 0 & \alpha_y & y_0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} X_c \\ Y_c \\ Z_c \\ 1 \end{bmatrix}, \quad (8)$$

where

- $\alpha_x$  and  $\alpha_y$  are focal lengths in pixel unit.
- $x_0$  and  $y_0$  are image center in pixel unit.
- $s$  is skew parameter.

## *4 steps projecting a 3D world point to a 2D image point*

A  $3 \times 4$  projection matrix  $\mathbf{P}$  denotes relationship between  ${}^W\mathbf{X}_w$  and  ${}^I\mathbf{x}$  as

$${}^I\mathbf{x} = \mathbf{P} {}^W\mathbf{X}_w, \quad (9)$$

$$\rightarrow s \begin{bmatrix} {}^Ix_d \\ {}^Iy_d \\ 1 \end{bmatrix} = \begin{bmatrix} p_{11} & p_{12} & p_{13} & p_{14} \\ p_{21} & p_{22} & p_{23} & p_{24} \\ p_{31} & p_{32} & p_{33} & p_{34} \end{bmatrix} \begin{bmatrix} {}^WX_w \\ {}^WY_w \\ {}^WZ_w \\ 1 \end{bmatrix}. \quad (10)$$

## *1/4: A 3D world point to a 3D camera point*

Change the world coordinate system to the camera one.

- From a 3D point  ${}^W\mathbf{X}_w$  in metric system w.r.t. the world coordinate
- To a 3D point  ${}^C\mathbf{X}_w$  in metric system w.r.t. the camera coordinate

$${}^C\mathbf{X}_w = [{}^C\mathbf{R}_w | {}^C\mathbf{T}_w] {}^W\mathbf{X}_w, \quad (11)$$

$$\rightarrow s \begin{bmatrix} {}^C X_w \\ {}^C Y_w \\ {}^C Z_w \\ 1 \end{bmatrix} = \begin{bmatrix} R_{11} & R_{12} & R_{13} & t_{14} \\ R_{21} & R_{22} & R_{23} & t_{24} \\ R_{31} & R_{32} & R_{33} & t_{34} \end{bmatrix} \begin{bmatrix} {}^W X_w \\ {}^W Y_w \\ {}^W Z_w \\ 1 \end{bmatrix}. \quad (12)$$

## 2/4: A 3D camera point to a 2D camera point

Change the 3D camera coordinate system to the 2D camera one.

- From a 3D point  ${}^C\mathbf{X}_w$  in metric system w.r.t. the camera coordinate
- To a 2D point  ${}^C\mathbf{X}_u$  in metric system w.r.t. the camera coordinate

$${}^C\mathbf{X}_u = [{}^C\mathbf{R}_w | {}^C\mathbf{T}_w]^W \mathbf{X}_w, \quad (13)$$

$$\rightarrow s \begin{bmatrix} {}^C X_u \\ {}^C Y_u \\ 1 \end{bmatrix} = \begin{bmatrix} f & 0 & 0 & 0 \\ 0 & f & 0 & 0 \\ 0 & 0 & 1 & 0 \end{bmatrix} \begin{bmatrix} {}^W X_w \\ {}^W Y_w \\ {}^W Z_w \\ 1 \end{bmatrix}, \quad (14)$$

$${}^C X_u = \frac{f}{{}^W Z_w} {}^W X_w \qquad {}^C Y_u = \frac{f}{{}^W Z_w} {}^W Y_w,$$

where  $f$  denotes focal length in metric system.

### 3/4: Lens distortion

Practical lens distort the previous 3D→2D projection.

$${}^cX_u = {}^cX_d + \delta_x \quad {}^cY_u = {}^cY_d + \delta_y, \quad (15)$$

where  $\delta_x$  and  $\delta_y$  denote distortion parameter along with each axis.  
In the case of no lens distortion,

$$\delta_x = 0 \quad \delta_y = 0 \quad (16)$$

- Radial distortion  $\delta_{xr}$  and  $\delta_{yr}$ ,
- Decentering distortion  $\delta_{xd}$  and  $\delta_{yd}$ ,
- Thin prism distortion  $\delta_{xp}$  and  $\delta_{yp}$ .

## 4/4: A 2D camera point to a 2D image point

Change the 2D camera coordinate system to the 2D image one.

- From a 2D point  ${}^C\mathbf{X}_d$  in metric system w.r.t. the camera coordinate
- To a 2D point  ${}^I\mathbf{X}_d$  in pixel system w.r.t. the camera coordinate

$$s \begin{bmatrix} {}^IX_d \\ {}^IY_d \\ 1 \end{bmatrix} = \begin{bmatrix} -k_u & 0 & u_0 \\ 0 & -k_v & v_0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} {}^CX_d \\ {}^CY_d \\ 1 \end{bmatrix}, \quad (24)$$
$${}^IX_d = -k_u {}^CX_d + u_0 \quad {}^IY_d = -k_v {}^CY_d + v_0,$$

where

- parameters  $(k_u, k_v)$  transform from metric measures to pixel.
- $(u_0, v_0)$  define the projection of the focal point in the plain.

## Camera calibration: General idea

### Task

Compute camera parameters:

- Packed parameters  $\mathbf{P}$ .
- Each components  $\mathbf{A}$ ,  $\mathbf{R}$ , and  $\mathbf{t}$ .

### Given

- Known 3D points  $\{\mathbf{X}_i | i = 1, \dots, N\}$ .
- Observed 2D points  $\{\mathbf{x}_i | i = 1, \dots, N\}$ .

## Camera calibration: Projective matrix estimation

Setting  $p_{34} = 1$ ,  $i$ -th image point  $\mathbf{x}_i$  is written as

$$x_i = \frac{X_i p_{11} + Y_i p_{12} + Z_i p_{13} + p_{14}}{X_i p_{31} + Y_i p_{32} + Z_i p_{33} + 1} \quad (25)$$

$$y_i = \frac{X_i p_{21} + Y_i p_{22} + Z_i p_{23} + p_{24}}{X_i p_{31} + Y_i p_{32} + Z_i p_{33} + 1} \quad (26)$$

Solve as an optimization problem w.r.t.  $\mathbf{P}$  such as

- 1 Linear method 1 solves as  $\mathbf{Ax} = \mathbf{b}$ .
- 2 Linear method 2 solves as  $\mathbf{Ax} = \mathbf{0}$ .
- 3 Non-linear method solves non-linearly.

## Camera calibration: Linear method 1

Proposed by [Hall et al., 1982]<sup>3</sup>.

Eq. (25) and Eq. (26) is rewritten as

$$X_i p_{11} + Y_i p_{12} + Z_i p_{13} + p_{14} - x_i X_i p_{31} - x_i Y_i p_{32} - x_i Z_i p_{33} = x_i \quad (27)$$

$$X_i p_{21} + Y_i p_{22} + Z_i p_{23} + p_{24} - y_i X_i p_{31} - y_i Y_i p_{32} - y_i Z_i p_{33} = y_i \quad (28)$$

Given  $N$  corresponding points  $\{\mathbf{X}_i\}$  and  $\{\mathbf{x}_i\}$ , generate following equation:

$$\begin{bmatrix} X_1 & Y_1 & Z_1 & 1 & 0 & 0 & 0 & 0 & -x_1 X_1 & -x_1 Y_1 & -x_1 Z_1 \\ 0 & 0 & 0 & 0 & X_1 & Y_1 & Z_1 & 1 & -y_1 X_1 & -y_1 Y_1 & -y_1 Z_1 \\ \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots \\ X_N & Y_N & Z_N & 1 & 0 & 0 & 0 & 0 & -x_N X_N & -x_N Y_N & -x_N Z_N \\ 0 & 0 & 0 & 0 & X_N & Y_N & Z_N & 1 & -y_N X_N & -y_N Y_N & -y_N Z_N \end{bmatrix} \begin{bmatrix} p_{11} \\ p_{12} \\ \vdots \\ p_{32} \\ p_{33} \end{bmatrix} = \begin{bmatrix} x_1 \\ y_1 \\ \vdots \\ x_N \\ y_N \end{bmatrix} \quad (29)$$

$$\rightarrow \mathbf{A}\mathbf{p} = \mathbf{b}$$

where  $\mathbf{A} \in \mathbb{R}^{2N \times 11}$ ,  $\mathbf{p} \in \mathbb{R}^{11}$ , and  $\mathbf{b} \in \mathbb{R}^{2N}$ .

---

## Camera calibration: Linear method 1 cont.

Considering an energy function  $E_1 = \|\mathbf{A}\mathbf{p} - \mathbf{b}\|^2$ , projection matrix is obtained by minimizing  $E_1$  as

$$\hat{\mathbf{p}} = \arg \min_p E_1 = \arg \min_p (\mathbf{A}\mathbf{p} - \mathbf{b})^T (\mathbf{A}\mathbf{p} - \mathbf{b}) \quad (30)$$

Differentiating  $E_1$  w.r.t.  $\mathbf{p}$ ,

$$\begin{aligned} \frac{\partial E_1}{\partial \mathbf{p}} &= 0 \\ \rightarrow \mathbf{A}^T (\mathbf{A}\hat{\mathbf{p}} - \mathbf{b}) &= 0 \\ \rightarrow \mathbf{A}^T \mathbf{A}\hat{\mathbf{p}} &= \mathbf{A}^T \mathbf{b} \\ \rightarrow \hat{\mathbf{p}} &= (\mathbf{A}^T \mathbf{A})^{-1} \mathbf{A}^T \mathbf{b} \end{aligned} \quad (31)$$

$\mathbf{p}$  can be estimated if  $\mathbf{A}^T \mathbf{A}$  is invertible.

## *Camera calibration: Linear method 1 cont.*

This method heavily relies on whether the matrix  $\mathbf{A}^T \mathbf{A}$  is invertible or not. Alternatively, we solve the problem by solving  $\mathbf{A}\mathbf{x} = \mathbf{0}$  as Linear method 2 does.

## Camera calibration: Linear method 2

Eq. (25) and Eq. (26) is rewritten as

$$X_i p_{11} + Y_i p_{12} + Z_i p_{13} + p_{14} - x_i X_i p_{31} - x_i Y_i p_{32} - x_i Z_i p_{33} - x_i p_{34} = 0 \quad (32)$$

$$X_i p_{21} + Y_i p_{22} + Z_i p_{23} + p_{24} - y_i X_i p_{31} - y_i Y_i p_{32} - y_i Z_i p_{33} - y_i p_{34} = 0 \quad (33)$$

$$\begin{bmatrix} X_1 & Y_1 & Z_1 & 1 & 0 & 0 & 0 & 0 & -x_1 X_1 & -x_1 Y_1 & -x_1 Z_1 & -x_1 \\ 0 & 0 & 0 & 0 & X_1 & Y_1 & Z_1 & 1 & -y_1 X_1 & -y_1 Y_1 & -y_1 Z_1 & -y_1 \\ \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots & \vdots \\ X_N & Y_N & Z_N & 1 & 0 & 0 & 0 & 0 & -x_N X_N & -x_N Y_N & -x_N Z_N & -x_N \\ 0 & 0 & 0 & 0 & X_N & Y_N & Z_N & 1 & -y_N X_N & -y_N Y_N & -y_N Z_N & -y_N \end{bmatrix} \begin{bmatrix} p_{11} \\ p_{12} \\ \vdots \\ p_{33} \\ p_{34} \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ \vdots \\ 0 \\ 0 \end{bmatrix} \quad (34)$$

$$\rightarrow \mathbf{A} \mathbf{p} = \mathbf{0}$$

where  $\mathbf{A} \in \mathbb{R}^{2N \times 12}$  is points matrix,  $\mathbf{p} \in \mathbb{R}^{12}$  is unknown projection matrix parameters vector, and  $\mathbf{b} \in \mathbb{R}^{2N}$  is 2D points vector

## Camera calibration: Linear method 2 cont.

To obtain the non-trivial solution of homogeneous system  $\mathbf{A}\mathbf{p} = \mathbf{0}$ , apply constrained optimization.

Considering an energy function  $E_2 = \|\mathbf{A}\mathbf{p}\|^2$  subject to the constraint  $\|\mathbf{p}\|^2 - 1 = 0$ , prevents  $\mathbf{p}$  from becoming a zero vector.

With a Lagrange multiplier  $\lambda > 0$ , we obtain the following energy function

$$\begin{aligned} E_2(\mathbf{p}, \lambda) &= \|\mathbf{A}\mathbf{p}\|^2 - \lambda(\|\mathbf{p}\|^2 - 1) \\ &= (\mathbf{A}\mathbf{p})^T (\mathbf{A}\mathbf{p}) - \lambda(\mathbf{p}^T \mathbf{p} - 1). \end{aligned} \quad (35)$$

$$\hat{\mathbf{p}} = \arg \min_{\mathbf{p}} E_2(\mathbf{p}, \lambda) = \arg \min_{\mathbf{p}} (\mathbf{A}\mathbf{p})^T (\mathbf{A}\mathbf{p}) - \lambda(\mathbf{p}^T \mathbf{p} - 1) \quad (36)$$

## Camera calibration: Linear method 2 cont.

Differentiating  $E_2$  w.r.t.  $\mathbf{p}$

$$\frac{\partial E_2}{\partial \mathbf{p}} = 0$$

$$\rightarrow \mathbf{A}^T \mathbf{A} \hat{\mathbf{p}} - \lambda \hat{\mathbf{p}} = 0$$

$$\rightarrow \mathbf{A}^T \mathbf{A} \hat{\mathbf{p}} = \lambda \hat{\mathbf{p}}$$

(37)

Differentiating  $E_2$  w.r.t.  $\lambda$

$$\frac{\partial E_2}{\partial \lambda} = 0$$

$$\rightarrow \hat{\mathbf{p}}^T \hat{\mathbf{p}} - 1 = 0$$

$$\rightarrow \|\hat{\mathbf{p}}\|^2 = 1$$

(38)

## Camera calibration: Linear method 2 cont.

Pre-multiplying both sides of Eq. (37) by  $\hat{\mathbf{p}}^T$  gives

$$\begin{aligned}\hat{\mathbf{p}}^T \mathbf{A}^T \mathbf{A} \hat{\mathbf{p}} &= \lambda \hat{\mathbf{p}}^T \hat{\mathbf{p}} \\ \rightarrow (\mathbf{A} \hat{\mathbf{p}})^T (\mathbf{A} \hat{\mathbf{p}}) &= \lambda 1 \\ \rightarrow \|\mathbf{A} \hat{\mathbf{p}}\|^2 &= \lambda\end{aligned}\tag{39}$$

Eq. (39) is the same expression that  $E_2 = \|\mathbf{A} \mathbf{p}\|^2$ . This means that minimizing  $\|\mathbf{A} \mathbf{p}\|^2$  is to minimize  $\lambda$ .

## *Camera calibration: Linear method 2 cont.*

Differencing the energy function  $E_2$  tells that

- Since Eq. (37) forms like  $\mathbf{Ax} = \lambda\mathbf{x}$ ,  $\hat{\mathbf{p}}$  should be an eigenvector of the matrix  $\mathbf{A}^T\mathbf{A}$  whose corresponding eigenvalue is  $\lambda$ .
- Eq. (38) minimizes  $\lambda$  as much as possible (ideally 0)

Thus,  $\hat{\mathbf{p}}$  should be the eigenvector corresponding to the smallest eigenvalue of the matrix  $\mathbf{A}^T\mathbf{A}$ .

## *Camera calibration: Projective matrix decomposition*

Now, we have

- An estimate of projective matrix  $\mathbf{P}$ .
- A set of corresponding points  $\{\mathbf{X}_i\}$  and  $\{\mathbf{x}_i\}$ .

Next task is to decompose  $\mathbf{P}$  into  $\mathbf{A}$ ,  $\mathbf{R}$ , and  $\mathbf{t}$ .

Basically, we use constraint on matrix form

## Decomposition of the Camera Matrix

$$\mathbf{P} = \left[ \begin{array}{ccc|c} p_1 & p_2 & p_3 & p_4 \\ p_5 & p_6 & p_7 & p_8 \\ p_9 & p_{10} & p_{11} & p_{12} \end{array} \right]$$

$$\mathbf{P} = \mathbf{A}[\mathbf{R}|\mathbf{t}] \text{ or, equivalently,} \\ \mathbf{P} = \mathbf{K}[\mathbf{R}|\mathbf{t}] = \mathbf{K}[\mathbf{R}|\mathbf{-Rc}] = [\mathbf{M}|\mathbf{-Mc}]$$

## Decomposition of the Camera Matrix

$$\mathbf{P} = \left[ \begin{array}{ccc|c} p_1 & p_2 & p_3 & p_4 \\ p_5 & p_6 & p_7 & p_8 \\ p_9 & p_{10} & p_{11} & p_{12} \end{array} \right]$$

**$\mathbf{P} = \mathbf{A}[\mathbf{R}|\mathbf{t}]$  or, equivalently,**
